Change Request 01

Audit-log export launch requirement

PROGRAM	Project Atlas
CLASSIFICATION	Internal
DOCUMENT STATUS	Approved working record

Request summary

Customer-success interviews identified a gap in the original administrative controls: enterprise administrators need portable audit history for regulated reviews. The request was evaluated for schedule, security, and support impact.

A broader analytics dashboard was proposed during discovery. The authority rejected that addition because it was not necessary for launch and did not have an agreed owner or estimate.

Authority decision

The change authority approved audit-log export as a launch requirement so enterprise administrators can retain event history.

Maya Chen owns delivery coordination for the audit-log export requirement, including acceptance evidence and release notes.

Implementation notes

Engineering may implement the export through an asynchronous job or a bounded synchronous request. The architecture choice is delegated to the team and is not itself a program decision.

Documentation will explain retention limits and administrator permissions. Support will reuse the existing launch-readiness channel for questions; this does not create a new milestone.
